

Boring out the Dead Length collet Assembly as it comes from Hardinge:

- Check, if necessary reset, the dimensions shown in the above illustrations and thoroughly clean the spindle area and the Dead-Length Collet Assembly.
 - With the draw bar in its forward position, put the Dead-Length Collet Assembly in the spindle, insert 3 pins in the face and adjust the draw bar until the pins are just gripped. Back out slightly and lock the draw bar. Activate draw bar to close collet on pins.
 - When boring out the collet, for the best accuracy and repeatability the order hole should be bored .001 inch larger than the stock size.
 - When a step-type bore is required, finish bore to the size indicated, then face the bottom of the bore to provide a square shoulder. To assure the part seats against the shoulder of the step, under cut the corner where the bore & shoulder meet.
 - Take the Dead-Length Assembly out of the spindle and remove the 1/8" diameter pins from the slots (save these for re-machining).
- Machining the Stop for the 5C & 16C Ejector Stop:**
- Machining the Stop, which was packed separately, to conform to the bore and step in the Dead-Length Collet. The OD of the Stop should be approximately 1/64" less than the bore in the collet. The Stop must not bottom out on the Body before the part bottoms out on the step in the collet.
- Separating the Outer Collet and the inner Dead-Length Collet**
- Loosen and remove the Large hex Nut/Nuts.
 - Remove the Large Spring. The Spring Retainer can stay in the Outer Collet.
- 10029 Remove the two Bville Springs, Large Spring. Leave the Spring Retainer. See Illustration #2.
- Separate the Dead-Length Collet from the Outer Collet
 - Remove the Body from the Dead-Length Inner Collet. Use the Hardinge Spanner Wrench to hold the DL Collet and a open end wrench to turn the Body. Deburr collet. Do not remove Guide Body from Thru-Hole* DL Collet. Deburr & Clean Collet
- 5C-16C Dead-Length Collet : Adjusting the Solid Stop Illustrations 3 & 4**
- Loosen the Nut which is against the Body and adjust to obtain the desired distance from the end of the stop to the face of the Dead-Length Collet. Retighten the Nut. If extensions are required it is suggested that you drill and tap the face of the threaded Stop and make the extension with the same male thread.
- 5C-16C Dead-Length Ejector Stop: Mounting the Machined Stop Illustrations 1 & 2**
- Remove two 3/8" hex Nuts, then pull the Plunger and Small Spring from the Body.
 - Thread the Stop which was machined into the plunger. Tighten using two 5/8" open end wrenches.
 - If removed, slide the Small Spring, (or the Heavy Duty Small Spring-16C only), onto the stem of the Plunger. Insert Stop/Plunger/Spring into the Body.
 - Thread the 3/8" Nuts on the end of Plunger. Start with the face of the 3/8" Nut 1/8" from the face of the Plunger. Changing this dimension changes the ejector force. Lock second nut. See Illustration #1 & 2.
- All Dead-Length Collets Assemblies:**
- Thread the Body assembly, or Guide Body, into the Dead-Length Collet. Hold the DL

5C and 16C Dead-Length Collets and Step Chucks

Collet using the Hardinge DL Collet Spanner Wrench and tighten the Body using an open end wrench. **NOTES:** Do not grip the Dead-Length Inner Collet in a vise, pipe wrench or vise-grip because the collet will be permanently damaged and distorted resulting in improper and unsafe gripping of the workpiece.

16. If removed, thread the Spring Retainer into the Outer Collet. Hold the Collet using the Hardinge Collet wrench and tighten the Body (16C Ejector - Use a 3/16" pin Hardinge face spanner. All others use open end wrenches. See NOTE in Step 15.

Assembling the Outer Collet and Dead-Length Collet Assemblies:

17. Slide Dead-Length Collet into the Outer Collet aligning key with the keyway.
18. Slide the Spring onto the Threaded Stop. See illustration #2 & 3.
19. Slide the Large Spring onto the Body. See illustration # 1.
20. Slide the Large Spring onto the Guide Body. See illustration # 5
21. Slide the Large Spring and B-Ville Springs onto the Body. See illustration # 2.
22. Hold the Outer Collet with the Hardinge Collet Wrench, if necessary, and thread the Nut onto the assembly, adjusting to the dimensions shown in the illustrations using a Open end wrench. Where there are two nuts, lock the second nut against the first.
23. Tighten nut by hand until Large Spring is fully compressed then back off one full turn. Lock with second Nut See illustration # 2
24. Thoroughly clean the assembly as well as the collet seat and back bearing in the machine's spindle.
25. With the draw bar in its forward position, put the Dead-Length Collet Assembly in the spindle, insert a part and adjust the draw bar until the part is lightly gripped. Back out slightly until the part can be removed. Lock the draw bar.

EJECTOR STOP: If the part does not eject from the collet:

26. Too little clearance between the Stop and the Bore. Decrease the OD of the Stop.
27. The Small Spring is not strong enough. Use Heavy Duty Small Spring furnished. See illustration # 2

Capacity

Dead Length Collet	"A" Chucking Diameter	"B" Maximum Depth of Step	"C" Pilot Hole
5C Emergency	Up to 55/64" (21.82mm) 55/64" to 1" (21.82 to 25.4mm)	2-1/8" (53.96mm) 1-3/8" (34.93mm)	1/8" (3.18mm)
5C Emer. Step Chuck	2" (50.80mm)	1/2" (12.70mm)	1/4" (6.35mm)
